

Project 2: Chrome DevTools Demo Implementations

This report documents practical implementations inspired by Chrome DevTools Console and JavaScript debugging tutorials.

Implemented Requirements

- Message Logging: Log Info, Log Warning, Log Error, Log Table, Log Group, Log Custom.
- View messages logged by the browser: trigger 404 network failure, uncaught TypeError, and a Violation (long click handler simulation).
- Filter messages workflow: by log level, text, regular expression, source, and user messages (Console sidebar instructions included in UI).
- Reproduce a bug: calculator begins in buggy string-concatenation mode so $5 + 1$ becomes 51.
- Get familiar with Sources UI: instructions in app point to relevant functions in script.js.
- Pause code with breakpoint and set line-of-code breakpoint: runBuggyCalculator and computeSum are explicit targets.
- Check variable values with Scope pane and Watch expression: typeof sum.
- Use Console while paused: evaluate parseInt(addend1) + parseInt(addend2).
- Apply a fix: Apply Fix button switches compute path to numeric parsing (base-10 parseInt), changing output to 6 for 5 and 1.
